

# Process Automation Solutions

## What we do

We recognise that doing a “lift and shift” of your current business processes to an outsourced managed model may not achieve your business transformation strategy and vision and that you may need the combined power of this and intelligent process automation.

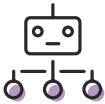

We work with you to ensure that the target business process will benefit from intelligent automation solutions such as chatbots, robotic process automation (RPA) and machine learning models.

## Benefits

### Combine the power of human business expertise and process automation

Accelerate your business operations deliverables in time and scale.

Finding new and innovative ways to automate your business processes frees up your workforce to work on more important and engaging tasks.

Creating flexible solution designs which react to real time data footprint and are scalable means they can be easily extended.

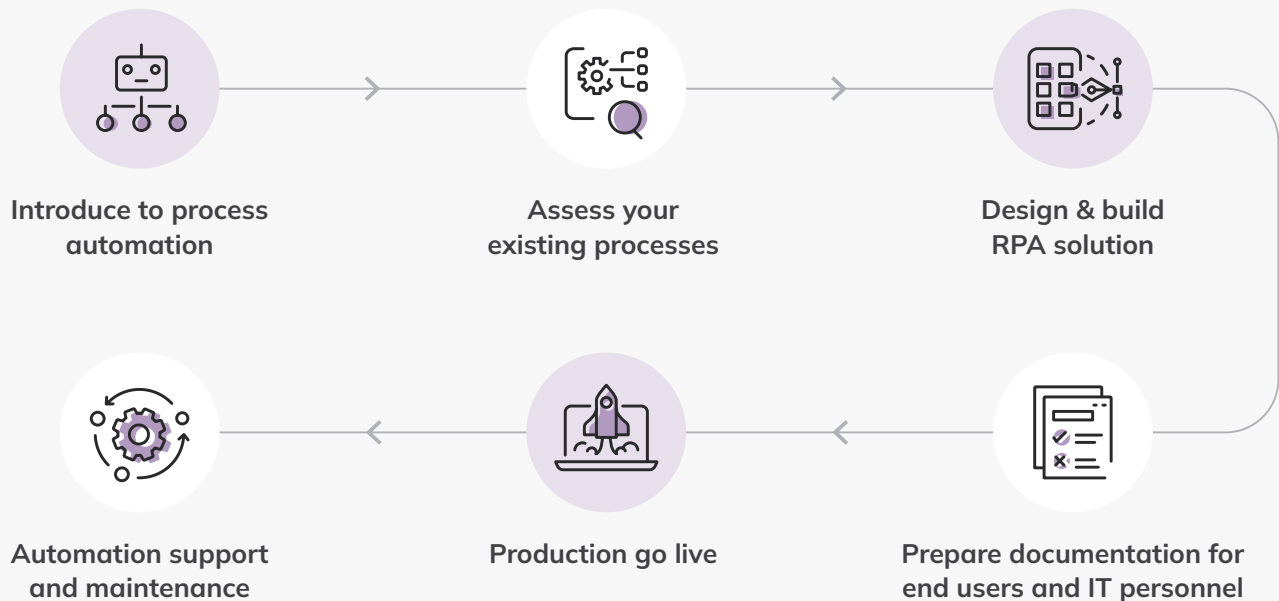

Deploying RPA is fast. Automation boosts productivity, increasing the processing time by as much as 5x in comparison to human processing time, and providing pinpoint accuracy.

## Our process

We start with an introduction to process automation so that you understand what this technology is capable of, its limitations and how it can be used to optimise your business processes. After assessing your existing processes, we design and build the RPA solution with saving time and money at the fore. We use SCRUM methodology to keep you up to date with what we have developed, the issues we encountered, and next steps.

For each project we prepare documentation for end users and IT personnel (about configuration, schedule, used components etc.), but the project does not end at production go live. Our Support & Maintenance team offer a full automation support and maintenance service to ensure your automation ecosystem remains optimal in terms of both efficiency and scale.

## Why NashTech

Our knowledgeable and experienced automation team has many different competencies including RPA developers, software engineers, business analysts, testers and project managers.

We are technology agnostic and choose the RPA platform that is the best suited for your needs, not based on our partnership's agreements. Our team is never idle – we stay fully up to date with trends in the intelligent automation market. We developed our own automation platform which we use for internal purposes and have knowledge in leading RPA platforms such as UiPath, Blue Prism, Power Automate, Automation Anywhere, NICE.

Need a partner to support you in automating high volume and repetitive tasks?
